

# Faults of the Bohemian Massif

This web will review some main features of the most important faults in the Bohemian Massif and its close neighbourhood. This is still a provisional version set online for working purposes. Launching of the first public version is planned for summer 2021.

Emphasis will be given to those faults which were demonstrably active in Cenozoic and/or which are assumed to pose increased seismic hazard for the following thousands of years.

It will use a structured database of active faults and related local observations made or compiled by the **editors** between 2019 and 2021 and occasionally updated with new contributions.

You may navigate to your targets either via **map below** (please be patient, it downloads slowly) or via encyclopedic entries in the sidebar.

Read more on **usage and technicals** if you need it.

Later you may **download** the database if you want it in your own GIS (currently unavailable).
