

Faults of the Bohemian Massif

This page reviews some main features of the most important faults in the Bohemian Massif and its close neighbourhood. It uses a structured database of active faults and related observations made or compiled by [editors](#) between 2019 and 2021 and occasionally updated with new contributions. Emphasis is given to those faults which were demonstrably active in Cenozoic and which are assumed to pose increased seismic hazard for the following thousands of years.
